Milton B. Wise, Vice President and Vice Provost
Agricultural and Natural Resources

James R. Fischer, Director
S.C. Agricultural Experiment Station

FOREWORD

It is with pleasure that the South Carolina Agricultural Statistics Service presents that 1989 edition of South Carolina Crop Statistics. The agricultural statistics in this publication include revised crop acres, yield, production and value statistics at the State and county level for 1987, and preliminary estimates for 1988. Also included are data on number of farms, land in farms, commercial fertilizer, fruit and vegetable statistics, and quarterly on and off farm grain stocks estimates.

This bulletin is a cooperative effort between the National Agricultural Statistics Service of the United States Department of Agriculture, and the Department of Agricultural Economics and Rural Sociology and South Carolina Agricultural Experiment Station of Clemson University. This cooperative relationship increases efficiency by avoiding duplication of effort and conflicting reports. The Federal program serves to provide comparable statistics for all states, which are released in national reports, while State funds make it possible to prepare and publish more detailed statistics for South Carolina such as those presented in this bulletin.

We are indebted to thousands of South Carolina farmers who voluntarily give their time and effort to report various information relating to their farming operations. Without this voluntary cooperation, it would be impossible to make reliable estimates or compile this publication. Thanks to all of you who assisted in this effort. In addition to the voluntary reporters, I want to publicly thank my staff for their dedication in preparing this bulletin.

Sincerely,

Henry J. Power, Jr.

Henry J. Power, Jr.
State Statistician

The South Carolina Agricultural Experiment Station is a cooperative program financed from Federal and State funds. It is the policy of the Experiment Station to comply with the regulations of Title VI, the Civil Rights Act of 1964. Complaints may be filed with the Director, S. C. Agricultural Experiment Station, Clemson University, Clemson, S. C. 29631.

SOUTH CAROLINA CROP SUMMARY

1988

JANUARY: Although the first and last days of January were quite warm, the remainder of the month averaged considerably colder than usual. It was the coldest January in South Carolina since 1985. The precipitation during January was somewhat below the normal.

The harvest of soybeans was almost completed the first part of the month. Preparation of tobacco seed beds was active and other farm activities included repairing farm equipment and general farm maintenance.

FEBRUARY: South Carolina's weather during February was colder and drier than usual. The highest and lowest temperatures of the month occurred during the first week. Rainfall during February averaged considerably less than normal for all except the extreme southern portion of the State.

The drier than normal conditions during February were favorable for land preparation and other usual late winter agricultural activities such as tobacco seed bed preparation, caring of fruit trees and livestock, and equipment maintenance. Most small grain crops survived the colder than normal temperatures of the past two months and were generally in good condition at the end of February.

MARCH: It was the driest March in South Carolina since 1985. Statewide, rainfall averaged from two to three inches or 35 to 60 percent of normal. Although there were frequent changes in the temperature in March, there were fewer than usual extremes.

Small grains were responding well to top dressing by early March. Early planting of corn, watermelons and some vegetable crops was underway. Tobacco beds were reported in good condition. During the month farmers were busy with plowing and soil preparation prior to planting. Peaches were blooming by mid-month. Although orchards were in fair to good condition, some early varieties were hurt by cold weather.

APRIL: The weather during April had its ups and downs, but averaged near to slightly below normal. The frequent passage of weather fronts across the State during April produced an unusually large number of April showers, although the total monthly rainfall was slightly below normal over western and central South Carolina. The frequent periods of rain during April were beneficial to South Carolina agriculture, although the deeper layers of soil in western South Carolina were not fully recharged.

Corn planting was active throughout the month and virtually complete by the end of the month. Early stands were looking very good, and the crop was rated in good condition. Tobacco transplanting began slower than normal but increased steadily during the month and by the end of April was 88 percent complete with good condition reported. Cotton planting was also slow during the month with crop condition rated only fair. Small grains developed nicely during the month; with 80 percent of the wheat heading by late April. The

early blooming peaches showed signs of freeze damage. Peanut planting was underway by the end of the month.

MAY: South Carolina's weather during May was drier and cooler than normal over much of the State. The temperature averaged slightly below normal in the upstate, almost 2 degrees below normal in parts of the midlands, and near normal in the lower coastal plain. Precipitation during May was approximately 50% of normal statewide, although a few stations that experienced heavy thunderstorms during the month reported near-normal precipitation.

Planting activities continued for all crops in May. Cotton and peanut planting was almost complete by month's end. Soybean planting began by mid-May and made good progress due to scattered showers late in the month. Most fruit and vegetable crops were reported in fair to mostly good condition. Pastures and small grains were in good condition.

JUNE: June's weather was drier than normal over much of the State, as most of South Carolina averaged less than three and one half inches of precipitation during the month. The monthly temperature averaged near normal in the upper Piedmont but around one degree below normal elsewhere. The State received no substantial relief from developing drought conditions during June.

Soybeans were almost 90 percent planted by the end of June, even though there were dry weather conditions. The crop condition was fair to good during the month. Corn was rated fair to good by mid-month but declined to poor to fair by month's end. Cotton squaring was lagging behind normal with condition reported as mostly fair. Tobacco topping was very active during the month.

Peach harvest began in early June and by the end of the month was 30 percent complete. Watermelon and cantaloup harvest was underway during the last week of June.

Pastures deteriorated due to dry weather conditions. Small grain harvest was virtually complete by late month.

JULY: South Carolina's weather during July averaged hotter and drier than usual. The monthly rainfall varied from one to two inches below normal over all but southern South Carolina where the average monthly rainfall was more than three inches below normal.

The temperature averaged near or slightly above normal upstate but was one to three degrees above normal elsewhere during July.

The condition of most crops improved during July as scattered rain fall covered the State. The rain came too late to help most of the corn crop, as the hot, dry weather during June caused considerable damage. The July showers gave the tobacco crop a good boost, helping up stalk leaves to fill out. Soybean planting was complete by mid-month. Cotton was fruiting well, but maturity was behind normal. Peanuts were rated in fair to good condition while sorghum was rated as fair.

Peach harvest continued but was lagging 15 percent behind normal by the end of July. Watermelon and cantaloup harvest continued during the month.

Pastures were beginning to respond to the rain and were rated in fair condition as July ended.

AUGUST: The monthly temperatures across the State averaged from two to three degrees higher than usual with the only real break in heat occurring during the last few days of the month. August was unusually dry over northwestern South Carolina with less than two inches of precipitation recorded. Greenwood reported only 0.78 inches during the month. One of the largest monthly totals was 14.09 inches at Ridgeland, South Carolina.

During the first week of August, corn growers began harvest, but lagged considerably behind normal by month's end. Tobacco harvest was active, with some interruptions due to scattered showers. Cotton and soybean development was slower than normal due to dry weather conditions. Soybeans showed improvement as showers occurred late in the month. Light peanut harvest got underway the last week of August. The crop condition was fair to good during the month.

Peach harvest was nearing completion by the end of the month. Apple and grape harvesting was active but lagged behind normal at the end of the month. Condition was fair to good.

Pastures and hay crops were in fair to good condition.

SEPTEMBER: Fall came early to South Carolina this year with the first ten days of September considerably cooler than usual. For the first time this year, precipitation statewide averaged greater than normal. The condition of most crops improved during September. Streams and river elevations were up but still averaged well below normal as the month ended.

Tobacco harvest was virtually complete by mid-month. Corn harvest moved at a slower than normal pace due to rain and wet fields and was 20 percent below normal at month's end. Rainfall caused boll rot and hard lock in many cotton fields, and harvesting was behind normal by month's end. The soybean crop continued to improve, aided by excellent growing conditions.

Active apple harvest continued during the month and was about two-thirds complete by month's end. Grape harvest continued but still lagged below normal throughout the month.

Pastures responded to the abundant moisture and was much improved by month's end. Winter grazing planting got off to a good start and made good progress.

OCTOBER: It was the coldest October in more than a decade at some locations in South Carolina. The monthly average temperature varied from the low 60s along the coast to the mid 50s upstate, or 4 to 5 degrees below normal.

Although rainfall was below normal in many parts of the state during October, the increase in precipitation over previous months along with reduced evapotranspiration, gave considerable relief from the drought conditions that existed in South Carolina for some time.

Corn harvest was about 90 percent complete by mid-October, while soybean harvest was just getting underway. Cotton harvest got off to a very slow start but was very active between showers as the month ended. Freezing temperatures terminated growth of cotton and soybeans near mid-month. Peanut, sorghum and sweetpotato harvest continued throughout the month.

Late harvesting of apples and grapes was virtually complete by the end of October.

Pastures and hay crops continued to be rated in fair to good condition. Small grains and winter grazing crops were rated fair to good during October.

NOVEMBER: The weather during November was milder than usual. The monthly average temperature varied from near 50 degrees, or one degree above normal, in the extreme northwestern part of the State to 61 degrees, or 4 degrees above normal, near the south coast. Rainfall occurred at regular intervals during November and for the first time in several months averaged one to two inches above normal in the higher elevations of northwestern South Carolina.

Cotton harvest was almost complete by the end of November; soybean harvest was 10 percent ahead of normal. Sweetpotato and peanut harvest neared completion by month's end with condition rated at fair to good.

Apple harvest was complete by mid-November. Pecan condition was fair to good during the month.

Pasture condition statewide was reported as fair to good. Moisture levels were good for emerging small grains, with conditions fair to good.

DECEMBER: Light rainfall during the last few days of December, kept the monthly rainfall totals from being the lowest of record; however, rainfall was generally from two to three inches or more below normal. The first two thirds of December averaged colder than usual; however, as forecast, the temperature trend reversed near mid-month with the last ten days averaging well above normal.

Forest fires increased during December due to dry woodland conditions. The total number of acres burned more than tripled the acres burned in December 1987.

Cotton harvest was completed in early December. By month's end, the last portion of the 1988 soybean crop was out of the field. Small grain plantings continued during the month.

SOUTH CAROLINA--Acreage, Yield, Production and Value of Crops, 1987 and 1988

1/ Value based on utilized production. 2/ Rounded to nearest thousand.

1988 VEGETABLE ACREAGE DOWN

South Carolina's **harvested acreage** of all vegetable and small fruit commodities produced in 1988 was 43,920 acres, down 4 percent from the 45,620 acres harvested in 1987. Of the five leading commodities harvested, fresh market snap bean acreage was up 13 percent, tomato acreage was up 3 percent and watermelon acreage was up 2 percent. Cucumbers for pickles and sweetpotatoes showed declines of 15 and 11 percent repectively in acres harvested. Harvested acreage changes for other commodities were mixed with a few more showing increases than declines.

South Carolina's **value of production** for all vegetable and small fruit commodities was $60.7 million in 1988, 13 percent above the 1987 value of $53.6 million. The value of production for two of the five leading commodities showed an increase which more than offset declines in the other three leading commodities. Tomatoes and cucumbers for pickles had increases of 51 and 15 percent, respectively, while fresh market snap beans were down 22 percent, sweetpotatoes down 20 percent and watermelons down 19 percent.

More detailed information on the 1988 Vegetable Survey will be published in the "South Carolina Vegetable Statistics," May 1989.

1/National program estimate subject to revision-June, 1989. 2/Yield, production and average price in dozen bunches. 3/Includes: asparagus, beets, broccoli, cauliflower, cherry tomatoes, eggplant, honeydews, kale, mushrooms, pumpkins, spinach, sweet peas, turnips, and other miscellaneous and processing vegetables.

South Carolina Farm Numbers

The number of farms in SOUTH CAROLINA as of June 1, 1988 is estimated at 26,500, up 500 from the June 1, 1987 number of 26,000. This temporarily reverses the downward trend in farm numbers that has occurred for the past several decades. Total land in farms for 1988 is 5.3 million acres, up 100,000 acres from the 1987 land in farms estimate of 5.2 million acres. The average size of farm in 1988 is 200 acres-the same as 1987.

The number of farms in the UNITED STATES in 1988 is estimated at 2.16 million, down 1 percent from the 2.18 million in 1987. Total land in farms for 1988 is 999 million acres, down fractionally from 1987. This is the first year that land in farms has been below a billion acres. Since the number of farms has declined at a faster rate than land in farms, the average size of farms has increased from 461 in 1987 to 463 acres in 1988.

1/ Beginning in Sept. 1986, the survey dates were changes to Sept. 1 instead of Oct. 1, Dec. 1 instead of Jan. 1, and Mar. 1 instead of Apr. 1. 2/ Per program modification: on-farm corn, wheat and sorghum grain stock estimates discontinued. Off-farm barley and oats will be made as of June 1 each year; sorghum stock estimates each June 1 and Sept. 1. Beginning Sept. 1, 1988 off-farm barley stock estimates were restored for Sept. 1, Dec. 1 and Mar. 1. 3/ Prior to Sept. 1, 1986 the fourth quarter reference date for soybeans was Sept. 1 not Oct. 1. * Unpublished to avoid individual operations.
